Install OpenSSH

1️⃣ Update Package Lists

Before installing anything, make sure your package list is up to date:

```
apt update
```

> **Important**
>
> You need to be logged into the `root` user

2️⃣ Install OpenSSH Server

```
apt install openssh-server -y
```

3️⃣ Restart SSHD service

```
systemctl restart sshd
```

4️⃣ Check SSHD status

```
systemctl status sshd
```

> **Tip**
>
> Needs to be `active (running)`

🎉 **Congratulations! Youre all set**

SSH Connection

1️⃣ Generate an SSH Key (local)

```
ssh-keygen
```

- When prompted, choose a **custom key name** (e.g. SYT_3BHITS)

2️⃣ Navigate to the SSH Directory

```
cd ~/.ssh/
```

3️⃣ Copy the Public Key to the Server

```
ssh-copy-id -i <keyname>.pub -p <port> <username>@localhost
```

A. Connect Using SSH Key

```
ssh -p <port> -i <keyname> <username>@localhost
```

B. Connection using Password

```
ssh <username>@localhost -p <port>
```

Manually Upload SSH Key to Debian (if ssh-copy-id doesn't work)

```
scp -P <port> <keyname>.pub <username>@localhost:
```

📌 Note: Don't add anything after the `:` → the key will be copied to the user's home directory (~)

```
cat <keyname>.pub >> .ssh/authorized_keys
```

📌 Note: If you don't have `autorized_keys`, create the file

Add SSH Connection to Config file

> **Important**
>
> These commands are executed locally!

- Navigate to `~/.ssh/config`

Add the following (example):

```
Host    debian_DHCP
            Hostname localhost
            Port 4448
            User debian_admin
            IdentityFile ~/.ssh/SYT_3BHITS
```
